

VHDL與循序邏輯電路設計

Outline

- Process結構
- If-Then-Else 敘述
 - 基本語法格式
 - 多重判斷條件
 - 巢狀結構敘述
- 時脈觸發
- Case-When 敘述
- Loop 敘述
 - For-Loop敘述
 - While-Loop敘述
 - Exit When
- Exit 敘述

- 正反器設計
 - RS 正反器
 - JK 正反器
 - T型正反器
 - D型正反器
- Generic 敘述
- 計數器設計
 - 二進位計數器設計(隨堂練習)
 - 二進位上/下數計數器設計(隨堂練習)
 - 除N計數器設計(隨堂練習)
 - BCD計數器設計(隨堂練習)
 - BCD加法器設計(隨堂練習)
 - 移位暫存器設計(隨堂練習)

- 時序邏輯設計的重要介面。
- 可使用一個或多個Process結構。
- 每個Process結構都是同時動作的。

• 標籤:

- •標籤用來標示電路,通常是使用有意義的文字,例如 counter 10、clock_div...等
- End Process後的標籤可以省略,如果有使用標前,則 必須與開頭的標籤一致。
- · 整個電路設計若只有一個Process結構,可不放置標籤。

[標籤:] process(敏感信號列)

宣告變數;

Begin

描述電路功能(時序性描述;)

End process [標籤];

- 敏感信號列(Sensitivity List)
 - 可觸發此Process 動作的信號。
 - 若超過一個敏感信號,信號與信號之間須以逗點分隔。
 - Process 結構類似微處理器裡的中斷(Interrupt),並 非隨時都在工作,而是在任一個敏感信號有所變化時, 才會執行Process。內描述的動作。

```
[標籤:] process(敏感信號列)
宣告變數;

Begin
描述電路功能
(時序性描述;)

End process [標籤];
```

- 變數的宣告
 - 在 Process與Begin之間,用來宣告此Process所使用的 信號及變數。而宣告的格式如下:

```
Variable 變數名稱1, 變數名稱2,...: 資料型態 [:=初值];
:
```

```
[標籤:] process(敏感信號列)
    宣告變數;

Begin
    描述電路功能
    (時序性描述;)

End process [標籤];
```

- 描述電路功能
 - 在 Begin與End之間,為此Process 主要的部分,可利用時序性語法,描述電路的動作,而其動作是按描述的順序。

• 基本語法格式

```
If 判斷條件Then
電路描述 1;
Else
電路描述 2;
End If;
```

·若其中有處理程序為不做人和處理時處理任何,應使用「null」。

```
If 判斷條件Then
電路描述;
Else
null;
End If;
```

• 基本語法

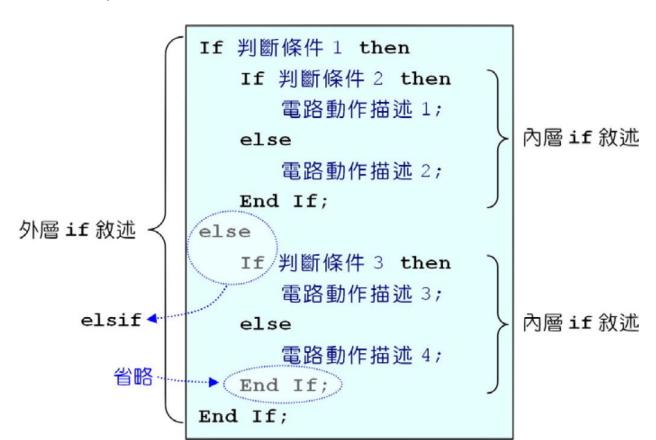

```
Library IEEE;
Use IEEE.std logic 1164.all;
Use IEEE.std logic unsigned.all;
Entity ADDSUB is
    Port(A, B:in std logic vector(7 downto 0);
        Cin, ADDSUB: in std logic;
        Co:out std logic;
        Results: out std logic vector (7 downto 0));
End ADDSUB;
Architecture ARCH of ADDSUB is
Begin
    Process(A, B, Cin, ADDSUB)
        Variable TMP: std logic vector(8 downto 0);
    Begin
        If ADDSUB = '1' Then
             TMP := '0' & A + B + Cin;
        Else
             TMP := '0' & A - B - Cin;
        End If;
        Results <= TMP(7 downto 0);</pre>
        Co \leq TMP(8):
    End Process:
End ARCH;
```

• 多重判斷條件

```
If 判斷條件1 Then
電路描述1;
Elsif 判斷條件2 Then
電路描述2;
::
Else
電路描述n;
End If;
```

• 巢狀結構敘述

時脈觸發

- 時鐘脈波(簡稱時脈)
- 正緣觸發與負緣觸發

正緣觸發

```
Clk0:Process (clk)
Begin
If clk'event and clk='l' Then
電路動作描述;
End If;
End Process;
```

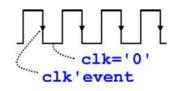

負緣觸發

```
Clk0:Process (clk)
Begin
If clk'event and clk='0' Then

電路動作描述;
End If;
End Process;
```

Case-When 敘述

- 屬於循序性敘述
- 常被使用在狀態機

```
      Case 控制項目is

      When 值1 或信號1 =>

      電路描述1;

      ::

      When 值2 或信號2 =>

      電路描述2;

      ::

      When others =>

      電路描述n;

      ::

      End Case;
```

- 控制迴圈結構,用於描述重複的電路動作,分為:
 - For-Loop
 - While-Loop
 - Loop
- 使用Exit When敘述,或結合If-Then-Else與Exit 跳出迴圈。

• For-Loop 敘述

```
[標籤:] For 控制變數in 範圍 Loop
電路描述 1;
::
End Loop [標籤];
```

- 標籤: 增加電路描述的可讀性,可有可無。
- 控制變數: 不須宣告(ex.i、j、k、cnt ···)
- 範圍:重複執行迴圈
 - 數值範圍:例如「0 to 7」
 - 列舉資料型態

• For-Loop 敘述範例

```
Library IEEE;
Use IEEE.std logic 1164.all;
Entity Parity11 is
    Port( Din:in std logic vector(0 to 10);
          ODD:out std logic);
End Parity11;
Architecture ARCH of Parity11 is
Begin
    Process (Din)
    Variable TMP: Boolean;
Begin
    TMP := false;
    For I in 0 to Din'length -1 Loop
        If Din(I) = '1' Then
        TMP := not TMP;
        End If;
    End Loop;
    If TMP Then
        ODD <= '1';
    Else
    ODD <= '0';
    End If;
End Process;
End ARCH;
```

• For-Loop 敘述範例一

```
Library IEEE;
Use IEEE.std logic 1164.all;
Entity Parity11 is
    Port( Din:in std logic vector(0 to 10);
          ODD:out std logic);
End Parity11;
Architecture ARCH of Parity11 is
Begin
    Process (Din)
    Variable TMP: Boolean;
Begin
    TMP := false;
    For I in 0 to Din'length -1 Loop
        If Din(I) = '1' Then
        TMP := not TMP;
        End If;
    End Loop;
    If TMP Then
        ODD <= '1';
    Else
    ODD <= '0';
    End If;
End Process;
End ARCH;
```

• For-Loop 敘述範例二

• While-Loop 敘述

提供先決條件判斷的迴圈敘述,只要判斷條件成立,則執行迴圈內的電路描述,其語法格式如下:

[標籤:] While 判斷條件 Loop 電路描述 1; :: End Loop [標籤];

基本上, While-Loop 敘述是用在撰寫測試平台(Test Bench), 產生激勵信號,以進行電路模擬,而不適用於合成電路。

• Exit When 敘述

在 Loop 迴圈裡,可利用Exit When 敘述跳出迴圈,其語法格式如下:

• Exit 敘述

對於無窮盡的 Loop 迴圈,可利用If-Then 敘述與Exit 敘述跳出迴圈,其語法格式如下:

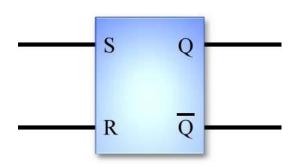

```
Loop
電路描述 1;
::
If 判斷條件Then Exit;
End Loop;
```

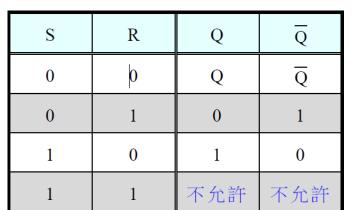

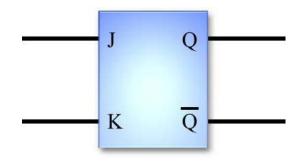

- 正反器(Flip-Flop)常被使用在各種循序邏輯的電路設計上,分為以下4種:
 - RS 正反器
 - JK 正反器
 - D 型正反器
 - T 型正反器

· RS正反器與JK正反器(簡單版本)

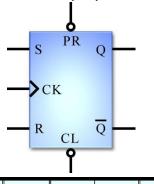

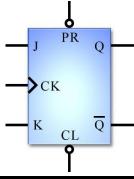

J	K	Q	Q
0	0	Q	$\overline{\overline{Q}}$
0	1	0	1
1	0	1	0
1	1	Q	Q

• JK正反器幾乎可以取代RS正反器。

• RS正反器與JK正反器(加入時脈、預設、清除)

PR	CL	CK	S	R	Q	Q
0	1	-	-	-	1	0
1	0	-	-	-	0	1
1	1	↑	0	0	Q	$\overline{\overline{Q}}$
1	1		0	1	0	1
1	1	↑	1	0	1	0
1	1	1	1	1	X	X

PR	CL	CK	J	K	Q	$\overline{\overline{Q}}$
0	1	-	-	1	1	0
1	0	-	-	1	0	1
1	1	1	0	0	Q	$\overline{\overline{Q}}$
1	1	1	0	1	0	1
1	1	1	1	0	1	0
1	1	1	1	1	Q	Q

• CK: 時脈(Clock) / PR: 預設(Preset) / CL: 清除(Clear)

• VHDL for RS正反器

End ARCH;

```
Library IEEE;
Use IEEE.std logic 1164.all;
Entity RSFF1 is
    Port( PR, CL, CK, R, S:in std logic;
          Q, Qbar:out std logic);
End RSFF1;
Architecture ARCH of RSFF1 is
Begin
    Process (PR, CL, CK)
    Variable TMP:std logic;
    Begin
        If PR='0' Then TMP := '1';
        Elsif CL='0' Then TMP := '0';
        Elsif Rising edge (CK) Then
            If S='0' and R='1' Then TMP := '0';
            Elsif S='1' and R='0' Then TMP := '1';
            Elsif S='1' and R='1' Then TMP := 'X';
            Else null;
            End If;
        End If;
        Q \ll TMP;
        Qbar <= not TMP;</pre>
    End Process;
```

PR	CL	CK	S	R	Q	$\overline{\overline{Q}}$
0	1	-	-	-	1	0
1	0	-	-	-	0	1
1	1	↑	0	0	Q	Q
1	1	↑	0	1	0	1
1	1	↑	1	0	1	0
1	1	1	1	1	X	X

• VHDL for JK正反器

```
Library IEEE;
Use IEEE.std logic 1164.all;
                                               PR
                                                   CL
                                                       CK
Entity JKFF1 is
                                               0
    Port( PR, CL, CK, J, K:in std logic;
          Q, Qbar: out std logic);
                                                    0
End JKFF1;
Architecture ARCH of JKFF1 is
Begin
    Process (PR, CL, CK)
    Variable TMP:std logic;
    Begin
        If PR='0' Then TMP := '1';
        Elsif CL='0' Then TMP := '0';
        Elsif Rising edge (CK) Then
             If J='0' and K='1' Then TMP := '0';
            Elsif J='1' and K='0' Then TMP := '1';
            Elsif J='1' and K='1' Then TMP := not TMP;
            Else null:
            End If;
        End If;
        Q <= TMP;
        Obar <= not TMP;</pre>
    End Process;
End ARCH;
```

· Generic 敘述的功能是將參數傳入設計裡,其格式如下:

• Generic範例:

Q為4bit匯流排,只要修改N,就可以修改匯流排寬度。

· 當作為Component電路時,需在Port Map敘述前使用Generic Map敘述將參數引入Component其格式如下:

Generic Map (參數)

• ex:

欲設定上升時間為1ns、下降時間為1ns,如下:

Generic Map(tRise => 1 ns, tFall => 1 ns)

• Generic 敘述範例

```
DEF1電路
Library IEEE;
Use IEEE.std logic 1164.all;
Entity DFF1 is
    Generic (wid:positive);
   Port( CL, CK: in std logic;
          D:in std logic vector( wid-1 downto 0);
          Q:out std logic vector(wid-1 downto 0));
    End DFF1;
Architecture ARCH of DFF1 is
Begin
    Process (CL, CK)
    Variable TMP : std logic vector( wid-1 downto 0);
    Begin
        If CL='1' Then
            TMP := (others => '0') ;
        Elsif Rising Edge(CK) Then
            For I in TMP'range Loop
                TMP(I) := D(I);
            End Loop;
        End If;
        O <= TMP;
    End Process;
End ARCH;
```

• Generic 敘述範例(續)

Entity NewDesign is

Use IEEE.std logic 1164.all;

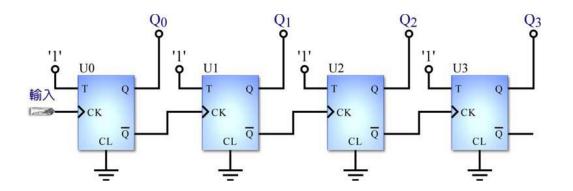

Library IEEE;

```
引用DEF1
  零件
類似Class
與0bject
```

```
Port( CL, CK:in std logic;
          Din:in std logic vector(7 downto 0);
          Dout: out std logic vector(7 downto 0));
End NewDesign;
Architecture ARCH of NewDesign is
    Component DFF1
        Generic (wid:positive);
        Port( CL, CK:in std logic;
              D:in std logic vector( wid-1 downto 0);
              Q:out std logic vector( wid-1 downto 0) );
        End Component;
    Constant wid8: positive := 8;
Begin
   DFF8: DFF1 Generic Map(wid8)
    Port Map (CL, CK, Din, Dout);
End ARCH;
```

計數器設計
